[022] A variable electrochromic optical attenuator is provided that is used to

control the intensity of a light signal. The electrochromic optical attenuator comprises a

ABSTRACT OF THE DISCLOSURE

semi-transparent electrochromic device, and a plurality of electrodes configured to

conduct electricity to the electrochromic device such that the transparency of the

electrochromic device will be affected by an amount proportional to the magnitude of

the electricity applied to the plurality of electrodes. The intensity of the light signal

transmitted through the electrochromic device is affected by an amount proportional to

the magnitude of the electricity applied to the plurality of electrodes. The

electrochromic optical attenuator also includes at least one polarizing element having an

optical polarization axis, wherein the polarizing element transmits a portion of the light

signal proportional to the angular difference between the optical polarization axis of the

light signal and that of the polarizing element. In one embodiment, the electrochromic

optical attenuator is employed in a laser package that includes a laser, a pair of

polarizing elements, and a faraday rotator.
